# Fallujah changes revealed with new satellite imagery and MapImager On-Line™

**Berkeley, CA, USA** — Telemorphic, Inc., a leading innovator in geospatial technologies, announces the immediate availability of MapImager On-Line™, now with interactive before/after satellite imagery of Fallujah, Iraq.  Live demonstrations of MapImager On-Line for Fallujah are publicly available at http://www.telemorphic.com/launch/imager-fal.htm [56k or faster connection recommended].

MapImager On-Line makes it fast, easy, and intuitive for anyone, including an unlimited number of visitors to an organization's website, to perform interactive comparisons of high resolution imagery and/or maps.  MapImager On-Line is also ideal for intranet use in order to share powerful yet easy to use Geographic Information Systems (GIS), and image analysis & visualization capabilities via web browser access anyplace, anytime.  Such net-centric capabilities have become mission critical in the post 9/11 world, particularly within the Defense, Intelligence, and Homeland Security sectors.

The satellite imagery, provided by DigitalGlobe, Inc., offers the most detail of any commercially available imagery, with a pixel resolution on the ground of 61cm (2ft).  The images were acquired on January 27, 2004 and Nov. 5, 2004, and represent an objective snapshot of the city before and after/during recent military activities there.

MapImager On-Line is powered by Maplicity™ and MapImager™, Telemorphic's revolutionary distributed GIS and geographic imaging technologies.  Maplicity w/MapImager is available as an off-the-shelf software extension for the industry leading Internet GIS and enterprise map server product, ESRI's ArcIMS.  This makes MapImager On-Line an easy and affordable add-on component for most organizations charged with distributing extensive archives of digital maps, imagery, and other spatial referenced databases since the product integrates transparently within their existing enterprise GIS and IT infrastructure.
